Date: September 26, 2022

Subject: Chastain Tract Residential Development
Edgmon Road / Lee Highway, Collegedale, Tennessee
Traffic Assessment Memorandum
Kimley-Horn Project Number: 014581004

Chastain Tract Residential Development is a proposed single-family housing development consisting of approximately 512 single-family detached units. To accommodate traffic from the proposed development, a roundabout is proposed to be installed with the east and west legs providing access to the development, and the north and south legs on Edgmon Road. **Appendix A** depicts the conceptual site plan for this development.

This summary memorandum has been prepared to summarize the transportation impacts of the proposed development for future year 2030.

INTRODUCTION

This memorandum presents the analysis of the anticipated traffic impacts associated with the *Chastain Tract Residential Development* which is expected to be completed in 2030 (referred to herein as build-out year). As currently envisioned, the development will consist of approximately 512 single-family detached units. The approximate 427.5-acre site is located on both the east and west side of Edgmon Road, south of Lee highway within the City of Collegedale.

This memorandum will summarize the analyses of the following scenarios:

- Existing 2022 Conditions
- Projected 2030 No-Build Conditions
- Projected 2030 Build Conditions

The study network for this analysis includes the following intersections:

1. Lee Highway at Edgmon Road
2. Proposed roundabout intersection at development site and Edgmon Road

For the purposes of this traffic analysis Lee Highway, and the development driveways are considered to have an east-west orientation. Edgmon Road is considered to have north-south orientation.

EXISTING CONDITINS

Turning movement counts (TMCs) were collected for four (4) hours on Wednesday, September 14, 2022, from 7:00 am to 9:00 am and 4:00 pm to 6:00 pm at the Lee Highway and Edgmon Road intersection.

Historical traffic data from the TDOT count stations was used to evaluate historic traffic trends and determine an appropriate growth rate for the study area. Based on review of the TDOT historical data, an annual growth rate of 2.0 percent was applied to the existing traffic volumes.

The traffic volume tables are provided in **Appendix B**.

DAILY TRIP GENERATION AND DISTRIBUTION

Traffic generated by the proposed development was calculated using equations provided in the *Trip Generation Manual, 11th Edition*, published by the Institute of Transportation Engineers (ITE). These calculations result in the following trips generated by the site.

Table 1 provides the trip generation for the proposed development.

Table 1 – Trip Generation								
ITE Land Use	Density	Daily Volumes	AM Peak Hour			PM Peak Hour		
			Total	Enter	Exit	Total	Enter	Exit
Single-Family Detached Housing (ITE Land Use 210)	512	4,534	329	86	243	461	290	171
New Trips		4,534	329	86	243	461	290	171

Based on the site plan, approximately 65% of the detached single-family units will be located east of Edgmon Road. It is proposed that 35% of the detached single-family units will be located west of Edgmon Road.

INTERSECTION CAPACITY ANALYSIS

The *Highway Capacity Manual (HCM) 6th Edition* provides insight and guidance on control delay, level of service (LOS), signalized intersection LOS, and unsignalized intersection LOS.

For existing roadways, municipalities typically consider LOS A through LOS D as the range of acceptable overall intersection operations, while LOS E and LOS F are generally considered unacceptable. Roadway laneage, traffic signalization, or other improvements are normally required at those intersections which operate within the range of unacceptable LOS.

The operating conditions for the signalized intersection were analyzed for the weekday AM and PM peak hours using the *Synchro 11* software which uses the methodologies contained in the *Highway Capacity Manual 6th Edition*.

The operating conditions for the proposed roundabout was analyzed for the weekday AM and PM peak hours using the *SIDRA Intersection 9* software which is a micro-analytical software tool used to analyze roundabout operations.

The intersection of Lee Highway at Edgmon road was analyzed with the Existing 2022, Projected 2030 No-Build Conditions and the Projected 2030 Build Conditions. The proposed roundabout intersection at the development and Edgmon Road was analyzed using Projected 2030 Build Conditions (as it does not exist today or during future no-build conditions).

Table 2 provides a summary of the level-of-service results.

Table 2: Level-of-Service Summary							
LOS (Delay in Seconds)							
Intersection	Approach/ Movement	Existing 2022		Projected 2030 No-Build		Projected 2030 Build	
		AM Peak	PM Peak	AM Peak	PM Peak	AM Peak	PM Peak
Lee Highway at Edgmon Road	Overall	A (7.8)	A (8.6)	A (8.3)	A (9.1)	A (10.0)	B (10.5)
Proposed Roundabout	Overall	-	-	-	-	A (4.8)	A (6.5)
	v/c ¹	-	-	-	-	0.220	0.443

1. Volume to capacity ratio

As summarized above the signalized intersection operates well within acceptable levels of service during future traffic build conditions and the roundabout projects to do the same with volume-to-capacity ratios well under capacity.

QUEUING ANALYSIS

The *Highway Capacity Manual 6th Edition* provides insight and guidance regarding the back of queue for signalized intersections.

“The back-of-queue position is the position of the vehicle stopped farthest from the stop line during the cycle as a consequence of the display of a red signal indication. The back-of-queue size depends on the arrival pattern of vehicles and on the number of vehicles that do not clear the intersection during the previous cycle.” (Source: *Highway Capacity Manual 6th Edition*, Chapter 19)

Table 3 summarizes the queuing length results for the signalized intersection.

Table 3 – Queue Length Results								
Intersection of Lee Highway at Edgmon Road								
Turn Movement		Existing Storage Length	AM (95 th Percentile)			PM (95 th Percentile)		
			Existing 2022	No-Build 2030	Build 2030	Existing 2022	No-Build 2030	Build 2030
Eastbound	Through	--	91	112	132	243	323	352
	Right-Turn	138	9	10	11	11	11	14
Westbound	Left-Turn	237	22	27	38	13	15	28
	Through	--	132	180	231	84	112	122
Northbound	Left-Turn	--	87	107	187	87	118	192
	Right-Turn	148	12	14	17	19	23	27

NOTE: All numbers represent distance in feet

The eastbound through movement does queue past the taper opening of the eastbound right-turn lane. This condition occurs today as an existing condition and projects to continue in the future No-Build 2030 and Build 2030 scenarios. Due to the proximity of the existing railroad right-of-way that is adjacent to the intersection, there is not existing right-of-way available to extend the existing right-turn lane. In conversations with City staff, we understand that the Railroad did not assist in providing right-of-way to extend the right-turn lane during the recently constructed TDOT-funded traffic signal and turn lane improvements. Therefore, it is also anticipated that they would also not assist the City and/or a private developer with a similar request. Hence, the existing situation is expected to remain which is: when the eastbound through movement receives a green indication at the signal, the queue will release, thereby providing right-turners access to the right-turn lane.

For the northbound Edgmon Road approach the northbound left-turn movement does queue past the taper opening for the northbound right-turn lane. This condition occurs during future build conditions. In order to provide access to the right-turn lane a two-lane northbound approach would need to be extended further south to provide 250' of storage for both the left-turn lane and the right-turn lane. To

accommodate this storage depth it would require widening the existing bridge to a 3-lane section. Just south of the bridge, the road could taper back down to a 2-lane section.

CONCLUSION

The intersection capacity analysis with Projected Build 2030 Conditions provides acceptable levels of service for both the signalized intersection and the proposed roundabout. However, the northbound approach of Edgmon Road is recommended to be widened to a 3-lane section (two (2) northbound lanes, one (1) southbound lane) across the existing bridge, thereby necessitating the widening of the existing bridge to a 3-lane section. The road would then taper back to a 2-lane section directly south of the existing bridge.

It is also important to reiterate and have the review agency understand the following:

- **The recommended improvement to widen the Edmon Road approach to a 3-lane section will be needed in future years even without this proposed development being built. The queues associated with the left-turn lane project to block access to the right-turn lane shortly after 2030 with the growth of other traffic volumes not associated with this development. This improvement will be needed whether or not this proposed development is built. However, it is recommended that the 3-lane section be constructed at approximately 45-55 percent buildout of this development. This is recommended to equate to the 275th Certificate of Occupancy (CO) for residential units in the development.**
- **The need for a longer eastbound right-turn lane at the intersection of Lee Highway / Edgmon Road exists today. The Railroad did not assist TDOT with additional right-of-way needs associated with the intersection improvements recently completed at Lee Highway / Edgmon Road, hence this improvement was not incorporated into that recently completed project. Therefore, it is also anticipated that they would also not assist the City and/or a private developer with a similar request.**

Please do not hesitate to call if anything further is needed. Respectfully Submitted,

KIMLEY-HORN AND ASSOCIATES, INC.

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Site tab).

Roundabout LOS Method: Same as Signalised Intersections.

Lane LOS values are based on average delay and v/c ratio (degree of saturation) per lane.

LOS F will result if v/c > 1 irrespective of lane delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all lanes (v/c not used as specified in HCM 6).

Roundabout Capacity Model: SIDRA Standard.

Delay Model: HCM Delay Formula (Geometric Delay is not included).

Queue Model: HCM Queue Formula.

Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Site tab).

Roundabout LOS Method: Same as Signalised Intersections.

Lane LOS values are based on average delay and v/c ratio (degree of saturation) per lane.

LOS F will result if v/c > 1 irrespective of lane delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all lanes (v/c not used as specified in HCM 6).

Roundabout Capacity Model: SIDRA Standard.

Delay Model: HCM Delay Formula (Geometric Delay is not included).

Queue Model: HCM Queue Formula.

Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.
